

## Learning Styles Indicator Profile for Susan Sample

This profile is based on your answers to the LSI (Learning Styles Indicator) – a questionnaire that looks at preferences in the way you learn and communicate.

There are 4 different learning styles, which everyone uses to some degree. They are neither good nor bad but people usually prefer one style over the others. By exploring your own preferences, it may help you to understand:

- the way you communicate and how this may come across to others
- the way you take in, learn and understand information
- the kind of environment and learning activities that may best suit you
- why you find different situations interesting, challenging or boring
- how you might need to change your style to make the most of different situations.

The questionnaire has been scored and the results displayed below. The overall indication is that your preferred learning style is the Creator which is marked as an 'X' in the boxes below. The closer the X is to the grid lines, the less clear your preference. This may mean you are flexible in your learning style or that you are unclear about which style you prefer.

If you join the dots on each of the lines (to make a diamond), the amount of space covered in the 4 areas shows your degree of preference for each learning style suggested by the questionnaire.

Think about your results by reading further descriptions of all 4 styles. Then:

- think about how much they truly reflect your natural style and preferences
- consider when you might use the other three learning styles
- discuss how your style helps and hinders you in different circumstances
- discuss how your style affects how you get on with others who are similar and different.
